A: Because strlen needs a char\* that ends with a 0. There are no 0's in char\*s (they usually have a length of 1 or 2 bytes) If you pass it a char\* that is not null-terminated (like your example) it will just keep on incrementing the pointer while it increments the length variable. Lan-Secure Wireless Protector Workgroup is a simple app that aims to cut access to an Internet connection for a group of local computers. This comes in the form of a standalone application for Windows Vista and Windows 7. The application is distributed as a set of multilingual installation packages, which include Windows Vista or Windows 7. The app is not meant for a PC with no access to the Internet, since it must of course, be connected to a connection. Should it not work properly, there are a few troubleshooting steps available for you to try. The application must be installed manually on any of your target computers. On first launch, you are taken through a wizard that aims to choose a network and select whether you want to add computers in the form of a text file, across an IP range or your local domain or workgroup. In the end, Lan-Secure Wireless Protector Workgroup will ask you to provide your credentials in order to access your local network. When you have selected the machines to monitor, Lan-Secure Wireless Protector Workgroup displays a window with details on each of them including IP address, hostname, and other basic info. Furthermore, you can get a more detailed view of each machine by taking advantage of their scan properties window. Lastly, reports can be issued to get an overall view of effectiveness.
