DeVerberate is seamlessly integrated in the Premium Edition and a light version with a.1. Field of the Invention The present invention relates to a device for discharging a liquid from a liquid container into which a liquid is charged and stored, which is also usable as a liquid jet-type liquid container, such as an ink jet printer cartridge. 2. Related Background Art In the prior art, there is known a liquid container (refer to Japanese Patent Application Laid-Open No. 9-247066) as shown in FIG. 4. This liquid container comprises a rigid substrate (base member) 2 formed in an approximately rectangular shape in cross section, and flexible laminate members (stainless steel foil) 3 laminated on both surfaces of the base member 2 to form a box shape. This flexible laminate member 3 is made by using a flexible material, such as a thin stainless steel foil, and forming an end plate portion and pressure receiving member portions to the inner and outer edges of the periphery of this stainless steel foil. The end plate portion has a rectangular opening 3A formed at a position facing a pressure receiving member portion and is formed to protrude from the inner periphery of the substrate 2. With this type of liquid container, when it is fixed in a liquid jet printer cartridge, the end plate portion of the flexible laminate member 3 is deformed so as to be elastically pressed in the direction of the substrate 2, thereby forming a reservoir 5, and when ink is supplied into the reservoir 5, the elastic deformation of the end plate portion of the flexible laminate member 3 is reversed to generate a pressure in the reservoir 5, thereby generating a pressure fluctuation with which the ink is ejected from the reservoir 5. When the flexible laminate member 3 made by forming the end plate portion and pressure receiving member portions by using the thin stainless steel foil is completely elastically pressed in the direction of the substrate 2, the end plate portion of the flexible laminate member 3 has a shape in which this end plate portion is bent toward the substrate 2 side as shown in FIG. 5 (an end plate portion 3E in FIG. 5 corresponds to the end plate portion 3E in FIG. 4), and when the flexible laminate member 3 is pressed in the opposite direction, there is a case where the end plate portion 3E comes into contact with the substrate 2 by a spring back effect, i.e., it is returned from the position in FIG. 5, so that the
